CS11021– Programming Laboratory (Intake 43)

Lab Sheet 6

Part I

1. Develop a program that accepts **two integer values** representing a student's **assignment mark** and **exam mark** from the keyboard.
Using **assignment, arithmetic, compound assignment, and increment/decrement operators only**, compute the **total marks, average, increment the assignment mark by 1, and decrement the exam mark by 1**.
Also compare whether both marks are equal and whether the assignment mark is greater than the exam mark using **relational operators**.
Use the **comma operator** at least once while reading input or printing output.
Display all results in a **clearly formatted output** with labels.
2. Develop a program that reads an employee's **basic salary** and **bonus amount** as floating-point values from the keyboard.
Using **arithmetic and compound assignment operators**, calculate the **gross salary** by adding the bonus to the basic salary.
Apply the **ternary operator** to determine whether the salary is **greater than or equal to a given threshold value** (fixed inside the program, no if).
Use **logical operators** to check multiple conditions related to the salary range.
Print the salary details and logical results using a **formatted output layout**.
3. Develop a program that accepts **three integer numbers** from the user.
Without using any selection or repetition statements, use **relational, logical, and assignment operators** to determine whether the first number is **greater than both remaining numbers**.
Use the **ternary operator** to assign a message value (1 or 0) representing the result.
Apply **compound assignment** on one of the numbers to modify its value.

Display the original inputs, modified value, and comparison results in a **structured format**.

4. Create a program that reads **two integers** from the keyboard.
Using only **arithmetic operators**, compute and display the **sum, difference, product, quotient, and remainder**.
Use **increment and decrement operators** to modify the first number before displaying the final result.
Apply the **comma operator** while printing multiple expressions in a single statement.
Ensure the output is **properly labeled and aligned** for readability.

5. Develop a program that takes **two integer values** from the user.
Using **logical operators** and **relational operators**, evaluate multiple expressions that combine comparisons and logical conditions.
Modify the values using **compound assignment operators**, including at least one **bitwise compound operator**.
Use the **ternary operator** to assign a final status value based on a logical expression.
Display all intermediate and final results using a **formatted output structure**.
